INTRODUCTION

A comprehensive data base of chemicals identified in human biological media (tissues and body fluids) has been established under the direction of the Exposure Evaluation Division in the U.S. Environmental Protection Agency's Office of Toxic Substances. This centralized resource of body-burden information has grown out of the concern of government scientists over continuing reports of toxic chemicals in human tissues and body fluids. This two-part volume is the annual publication of the data base for 1982.

Body burden is a reflection of exposures to food, air, and water contaminants, as well as administration of pharmaceuticals. The systematic acquisition of body-burden data will facilitate a more relevant assessment of human exposure to xenobiotics (including toxic chemicals) than was previously possible using environmental contamination levels.

Data were obtained primarily from the open literature through manual searches (retrospective to 1974) of the journals listed in Appendix A. The data base now contains information on over 1000 different substances, all of which are listed by Chemical Abstracts Service (CAS) preferred names in Appendix B. Appendix C lists, by CAS registry numbers and preferred names, the chemicals in Volume V. For the user's convenience, cross-referenced chemical lists of CAS preferred names and common names are provided in Appendix D. The human tissues and body fluids found to be contaminated by these chemicals are listed in Appendix E.

The data base is published annually in tabular format with indices and chemical listings that allow specific searching. The file is now available online in the U.S. Department of Energy's RECON and in 1983 will be in Lockheed's DIALOG.

The purpose of the data base is to provide a centralized resource of body-burden data, and in no way is it intended to obviate the need for the user to ultimately refer to the original literature or data source. It is not the intent of this program to conduct any screening or evaluation of the data.

This data base was established under the aegis of the Interagency Collaborative Group on Environmental Carcinogenesis (ICGEC), National Cancer Institute. Funding is through the National Cancer Institute-Environmental Protection Agency Collaborative Program. The work is being done by the Oak Ridge National Laboratory's Chemical Effects Information Center, Information Center Complex, through interagency agreements involving the National Cancer Institute, the Environmental Protection Agency, and the Department of Energy. Members of the ICGEC Task Group on Chemicals in Human Tissues provide support to the program's activities. Agencies represented by members of the task group include the Armed Forces Institute of Pathology, the Centers for Disease Control, the Department of Agriculture, the Department of Energy, the Environmental Protection Agency, the Food and Drug Administration, the National Bureau of Standards, the National Cancer Institute, the National Center for Toxicological Research, the National Institute for Environmental Health Sciences, the National Institute for Occupational Safety and Health, and the National Library of Medicine.

Comments by the users of this document are invited. Questions, comments, and requests for additional information about the data base and/or searches thereof should be directed to:

USERS' GUIDE

The data base is published annually in two parts. Part 1 contains introductory materials, references, full literature citations, appendices, indices, and a chemical directory. Part 2 contains body-burden data extracted since the most recent publication of the data base.

Data from almost 2400 of the 4400 body-burden documents collected to date have been entered in the data base as of October 1982. The emphasis on including recent literature and significant research documents has resulted in a chronological mix of articles from 1974 to the present.

When body-burden articles are identified, data are extracted and entered in the data base by chemical and tissue/body fluid. Each data entry comprises a single record (or line entry) and is assigned a record number. If a particular document deals with more than one chemical and/or tissue, there will be multiple records for that document. For example, a study of 5 chemicals in each of 3 tissues has 15 different records (or 15 line entries) in the data base with 15 record numbers. Record numbers are assigned consecutively throughout the entire data base and appear in the upper left corner of the first column for each record.

Part 2 contains the data base in tabular format. There are two sections, the first with records on nondrug substances, and the second with records on drugs. Chemicals in each section are arranged alphabetically by CAS preferred name. The sample record below illustrates the

format. The chemical, in this case arsenic, is given along with its CAS registry number, formula, atomic weight, melting point, boiling point, and vapor pressure. Tissues are listed alphabetically in the first column with the record number. In the sample record, the tissue is hair and the record number is 41.

Information in the next five columns — exposure route, analytical method, number of cases, range, and mean — is self-explanatory and is provided when available in the source document. A list of abbreviations used for analytical method is provided on page 7. Exponential values are written as in the following example: 5×10^{-15} is 5 × 10(E-15). All means are arithmetic unless designated geometric. When included, standard error is indicated by S.E. However, values for standard deviations, when given, have no such designations. When only graphically displayed data were available, values have been estimated by the extractor and so indicated in the table under GENERAL INFORMATION.

In the GENERAL INFORMATION column, a variety of information may be included that is pertinent to the range and mean as well as experimental design, demography, health effects, pathology, morphology, and toxicity. In general, supporting information deemed important for understanding the data presented appears in this column.

The REFERENCE column includes author(s), publication date, and source. Complete literature citations are listed alphabetically, by author, in References for Data Base in Part 1.

Because not all details of the research can be included in this publication, keywords, in uppercase letters, are provided for further insight into important aspects of the source documents. The use of a different chemical as a keyword indicates studies on that chemical were also reported in the same document. For example, CADMIUM may appear as a keyword in a record on mercury when the work includes data on both chemicals. In the same way, a different tissue occurring as a keyword indicates the document also deals with that tissue.

Review articles are included in the data base; however, no data have been extracted from such documents because the original research articles are included. Review articles are designated in the GENERAL INFORMATION column by the word *Review*.

CAS preferred names are from the *Ninth Collective Index*, and, when different, names from both eighth and ninth indices (8 CI, 9 CI) are given. Appendix D provides cross-referenced alphabetical lists of commonly used synonyms paired with the CAS preferred names.

For accessing information in the data base when only the CAS registry number is known, the user should refer to Appendix C, which lists CAS registry numbers coupled with the preferred names. For help in locating chemicals in the tabular portion of the document, an alphabetically arranged directory of chemicals by CAS names and record numbers is provided at the end of Part 1. The second part of the directory lists formulas alphabetically along with the corresponding CAS preferred names and record numbers. This directory includes only chemicals in Volume V (1982) of the data base (i.e., records 6012-7587). A list, by CAS preferred names, of chemicals in the entire data base (1979-1982) is found in Appendix B. Indices by author, corporate authority, tissue or body fluid, and keywords refer the user to the appropriate record number(s) in Volume V.

Note: The compound, 1-Butanol, 2-ethyl- is incorrectly listed under its synonym, Pseudohexyl alcohol, in record number 6705.

16. Abstract (Limit: 200 words)

A comprehensive data base of chemicals identified in human biological media (tissues and body fluids) has been established under the direction of the Environmental Protection Agency's Office of Toxic Substances Exposure Evaluation Division. This centralized resource of body-burden information was inspired by the concern of government scientists over continuing reports of toxic chemicals in human tissues and body fluids.

Body burden is a reflection of exposures to food, air, and water contaminants, as well as pharmaceuticals. The systematic acquisition of body-burden data will facilitate a more relevant assessment of human exposure to toxic chemicals and xenobiotics than was previously possible using environmental contamination levels.

Data were obtained primarily from the open literature through manual searches of selected journals. Retrospective searching to 1974 is complete and has yielded about 4400 pertinent documents of which approximately 2380 have been entered into the data base as of this report. These sources identify over 1000 chemicals that have been found in human biological media.
